Nordic Appliance Care - Salesforce Field Service Requirements
Version 1.2 - Prepared for the implementation partner

1. Background

Nordic Appliance Care repairs household appliances across Sweden and Norway. Today technicians receive jobs by phone and paper, and customers have no visibility of when a technician will arrive. The company wants to run its service operation on Salesforce Field Service.

2. Work Order Management

2.1 Work order intake

- Customer service agents must create a work order from a case in one click, copying the customer, address and appliance.
- Every work order must have a priority (Low, Medium, High, Critical) derived from the appliance warranty status.
- Work orders created outside business hours should be flagged for next-day dispatch.

2.2 Scheduling and dispatch

- Dispatchers must see all unscheduled work orders on the Gantt and schedule them to technicians by skill and territory.
- The system shall send the customer an SMS with the arrival window when an appointment is dispatched.
- Appointments must not be scheduled outside the technician’s working hours.

3. Mobile Technician Experience

- Technicians must be able to view the job, appliance history and parts list offline in the Field Service mobile app.
- Technicians shall capture the customer signature and photos before completing a job.
- When a job cannot be completed the technician must select a reason and the system should create a follow-up appointment.

4. Data Migration

- All active customers (approx. 60,000) and their appliances must be migrated from the legacy ServiceMax system.
- Open work orders and the last 24 months of service history shall be migrated with their original reference numbers.
- Duplicate customers must be merged before go-live. Matching rules are TBD with the data owner.

5. Integrations

- Spare parts stock must be checked in real time against the SAP warehouse API before a part is reserved.
- Completed work orders shall be sent to SAP for invoicing within 15 minutes.
- If SAP is unavailable the integration must retry and alert the support team.

6. Reporting

- Service managers need a dashboard with first-time fix rate, average travel time and SLA

compliance per territory.
- A weekly report of repeat visits per appliance model should be emailed to the quality team.

7. Security and Access

- Technicians may only see work orders in their own territory.
- Dispatchers and service managers need separate permission sets; partners must not access customer financial data.
